Paper 1

Thursday 15 June 2017          Morning          Time allowed: 2 hours

**Materials**

For this paper you must have:
* a pencil and a ruler
* a scientific calculator
* a Data and Formulae booklet.

**Instructions**

* Use black ink or black ball-point pen.
* Fill in the boxes at the top of this page.
* Answer **all** questions.
* You must answer the questions in the spaces provided.  Do not write outside the box around each page or on blank pages.
* Do all rough work in this book.  Cross through any work you do not want to be marked.
* Show all your working.

**Information**

* The marks for questions are shown in brackets.
* The maximum mark for this paper is 85.
* You are expected to use a scientific calculator where appropriate.
* A Data and Formulae Booklet is provided as a loose insert.

## Section A

Answer **all** questions in this section.

**0 1** An isotope of potassium $^{40}_{19}K$ is used to date rocks. The isotope decays into an isotope of argon $(Ar)$ mainly by electron capture.

**0 1 . 1** The decay is represented by this equation:

$$^{40}_{19}K \ + \ ^{0}_{-1}e \ \rightarrow \ ^{\ \ }_{\ }Ar \ + \ \underline{\qquad}$$

Complete the equation to show the decay by filling in the gaps.

**[2 marks]**

**0 1 . 2** Explain which fundamental interaction is responsible for the decay in question **01.1**.

**[2 marks]**

_____

_____

_____

_____

**0 1 . 3** One decay mechanism for the decay of $^{40}_{19}K$ results in the argon nucleus having an excess energy of $1.46 \ MeV$. It loses this energy by emitting a single gamma photon.

Calculate the wavelength of the photon released by the argon nucleus.

**[3 marks]**

wavelength = _____ m

| 0 1 . 4 | The potassium isotope can also decay by a second decay process to form a calcium-40 nuclide ($^{40}_{20}$Ca). |

Suggest how the emissions from a nucleus of decaying potassium can be used to confirm which decay process is occurring.

**0 2**  **Figure 1** shows an arrangement used by a student to investigate vibrations in a stretched nylon string of fixed length $l$. He measures how the frequency $f$ of first-harmonic vibrations for the string varies with the mass $m$ suspended from it.
**Figure 1**

Table 1 shows the results of the experiment.

**Table 1**

| $m$ / kg | $f$ / Hz |
|----------|----------|
| 0.50     | 110      |
| 0.80     | 140      |
| 1.20     | 170      |

**0 2 . 1**  Show that the data in **Table 1** are consistent with the relationship

$$f \propto \sqrt{T}$$

where $T$ is the tension in the nylon string.

**[2 marks]**

**0 2 . 2** The nylon string used has a density of $1150 \text{ kg m}^{-3}$ and a uniform diameter of $5.0 \times 10^{-4}$ m.

Determine the length $l$ of the string used.

**[3 marks]**

$l$ = _____ m

**0 2 . 3** The student uses the relationship in question **02.1** to predict frequencies for tensions that are much larger than those used in the original experiment.

Explain how the actual frequencies produced would be different from those that the student predicts.

**0 3** | **Figure 2** shows a ray of monochromatic green light incident normally on the curved surface of a semicircular glass block.

**Figure 2**

**0 3** . **1** The angle of refraction of the ray at the plane surface is $90°$.

Refractive index of the glass used = $1.6$

Calculate the angle of incidence of the ray on the flat surface of the block.

**[1 mark]**

angle of incidence = _____ degrees

**0 3 . 2** A thin film of liquid is placed on the flat surface of the glass block as shown in **Figure 3**.

**Figure 3**

film of liquid

The angle of incidence is changed so that the angle of refraction of the green light ray at the glass–liquid interface is again $90°$. The angle of incidence is now $58°$.

Calculate the refractive index of the liquid.

**[2 marks]**

refractive index = _____

**0 3 . 3** The source of green light is changed for one that contains only red and blue light. For any material red light has a lower refractive index than green light, and blue light has a higher refractive index than green light. The angle of incidence at the glass–liquid interface remains at $58°$.

Describe and explain the paths followed by the red and blue rays immediately after the light is incident on the glass–liquid interface.

**ANSWER IN THE SPACES PROVIDED**

| 0 | 4 |

An engineer wants to use solar cells to provide energy for a filament lamp in a road sign.

The engineer first investigates the emf and internal resistance of a solar cell under typical operating conditions.

The engineer determines how the potential difference across the solar cell varies with current. The results are shown in the graph in **Figure 4**.

**Figure 4**

The engineer uses the graph to deduce that when operating in typical conditions a single solar cell produces an emf of $0.70$ V and has an internal resistance of $8.0$ Ω.

| 0 | 4 | . | 1 |

Explain how the engineer uses the graph to obtain the values for the emf and internal resistance of the solar cell.

**[2 marks]**

**Question 4 continues on the next page**

**Turn over ▶**

To operate effectively the lamp in the road sign needs a minimum current of $75$ mA. At this current the resistance of the filament lamp is $6.0$ $\Omega$.

The engineer proposes to try the two circuits shown in **Figure 5** and **Figure 6**.

**Figure 5**

**Figure 6**

**0 6**     **Figure 8** shows a model of a system being designed to move concrete building blocks from an upper to a lower level.

**Figure 8**

The model consists of two identical trolleys of mass $M$ on a ramp which is at $35°$ to the horizontal. The trolleys are connected by a wire that passes around a pulley of negligible mass at the top of the ramp.

Two concrete blocks each of mass $m$ are loaded onto trolley **A** at the top of the ramp. The trolley is released and accelerates to the bottom of the ramp where it is stopped by a flexible buffer. The blocks are unloaded from trolley **A** and two blocks are loaded onto trolley **B** that is now at the top of the ramp. The trolleys are released and the process is repeated.

**Figure 9** shows the side view of trolley **A** when it is moving **down** the ramp.

**Figure 9**
**0 6 . 1** The tension in the wire when the trolleys are moving is $T$.

Draw and label arrows on **Figure 9** to represent the magnitudes and directions of any forces and components of forces that act on trolley **A** parallel to the ramp as it travels down the ramp.

**[1 mark]**

**0 6 . 2** Assume that no friction acts at the axle of the pulley or at the axles of the trolleys and that air resistance is negligible.

Show that the acceleration $a$ of trolley **B** along the ramp is given by

$$a = \frac{mg \sin 35^\circ}{M + m}$$

**[2 marks]**

**0 6 . 3** Compare the momentum of loaded trolley **A** as it moves downwards with the momentum of loaded trolley **B**.

**[2 marks]**

**Question 6 continues on the next page**

**Turn over ►**

*Do not write outside the box*

| 0 | 6 | . | 4 | In practice, for safety reasons there is a friction brake in the pulley that provides a resistive force to reduce the acceleration to $25\%$ of the maximum possible acceleration.

The distance travelled for each journey down the ramp is $9.0$ m.

The following data apply to the arrangement.

Mass of a trolley $M$ = 95 kg
Mass of a concrete block $m$ = 30 kg

Calculate the time taken for a loaded trolley to travel down the ramp.

**[3 marks]**

time = _____ s

| 0 | 6 | . | 5 | It takes $12$ s to remove the blocks from the lower trolley and reload the upper trolley.

Calculate the number of blocks that can be transferred to the lower level in $30$ minutes.

**0 7**    A student is investigating forced vertical oscillations in springs.
Two springs, **A** and **B**, are suspended from a horizontal metal rod that is attached
to a vibration generator.  The stiffness of **A** is $k$, and the stiffness of **B** is $3k$.
Two equal masses are suspended from the springs as shown in **Figure 10**.

**Figure 10**

The vibration generator is connected to a signal generator.  The signal generator
is used to vary the frequency of vibration of the metal rod.  When the signal
generator is set at $2.0 \text{ Hz}$, the mass attached to spring **A** oscillates with a
maximum amplitude of $2.5 \times 10^{-2}$ m and has a maximum kinetic energy of $54$ mJ.

**0 7 . 1**    Deduce the spring constant $k$ for spring **A** and the mass $m$ suspended from it.
**[4 marks]**

$k =$ _____ N m$^{-1}$

$m =$ _____ kg

**0 7 . 2** Calculate the frequency at which the mass attached to spring **B** oscillates with maximum amplitude.

**[2 marks]**

frequency = _____ Hz

**0 7 . 3** **Figure 11** shows how the amplitude of the oscillations of the mass varies with frequency for spring **A**.

**Figure 11**

The investigation is repeated with the mass attached to spring **B** immersed in a beaker of oil.

A graph of the variation of the amplitude with frequency for spring **B** is different from the graph in **Figure 11**.

Explain **two** differences in the graph for spring **B**.
