# A-level PSYCHOLOGY

Paper 2 Psychology in context

Friday 8 June 2018

Morning

Time allowed: 2 hours

# **Materials**

For this paper you may use:

· a calculator.

## Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page.
- Answer all questions. You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
- Do all rough work in this book. Cross through any work you do not want to be marked.

# Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 96.
- Questions should be answered in continuous prose. You will be assessed on your ability to:
  - use good English
  - organise information clearly
  - use specialist vocabulary where appropriate.

# **Section A**

# Approaches in psychology

Answer all questions in this section.

Answer an questions in this section.
Only <b>one</b> answer per question is allowed.
For each multiple-choice answer completely fill in the circle alongside the appropriate answer.
CORRECT METHOD WRONG METHODS © • S
If you want to change your answer you must cross out your original answer as shown.
If you wish to return to an answer previously crossed out, ring the answer you now wish to select as shown.
0 1 Which of the following statements about the cognitive approach is <b>FALSE</b> ?
Shade <b>one</b> box only.
A Inferences about internal mental processes are made on the basis of behaviour.
<b>B</b> Internal mental processes are studied scientifically.
C Mental processes are studied directly by making inferences.
<b>D</b> Theoretical and computer models are used to help explain mental processes.
[1 mark]
0 2 We use schema when we process information from the world around us.
Explain <b>one</b> reason why using schema might be useful when processing information from the world around us, and explain <b>one</b> reason why using schema might not be useful when processing information from the world around us.

	The psychologist was interested in finding out whether dream themes differed between males and females, particularly in terms of social interaction. She decided to conduct a pilot study. Twenty undergraduate students (8 male and 12 female) volunteered for the study. For a six-week period the students were interviewed at 9 am each morning when they arrived at university. Interviewers, who did not know the purpose of the study, carried out and recorded the dream interviews.
1 3	What is meant by a pilot study? Explain <b>one</b> possible reason why the psychologist decided to conduct a pilot study for this investigation.  [3 marks]

[6 marks]

Do not write outside the

The psychologist decided to conduct an experiment to investigate the effect of watching horror films before going to bed.

A volunteer sample of 50 university students consented to take part in the experiment.

The 50 students were randomly split into two groups. **Group 1** watched a horror film before going to bed each night for the first week then a romantic comedy before going to bed each night for the second week. **Group 2** watched the romantic comedy in the first week and the horror film in the second week.

When the students woke up each morning, each student received a text message that asked if they had had a nightmare during the night. They could respond 'yes' or 'no'.

**2 0** Write a brief consent form that would have been suitable for use in this experiment.

The consent form should:

- include some detail of what participants might expect to happen
- refer to ethical issues
- be in an appropriate format/style.

Extra space	

1	The psychologist proposed a directional hypothesis.		Do i out
	Write a directional hypothesis for this experiment.	[3 marks]	
2	The psychologist used a repeated measures design in this experiment.		
	Explain why it was important to use a repeated measures design in this case.	[2 marks]	
3	The psychologist used counterbalancing in this experiment.		
	Explain why it was appropriate to use counterbalancing in this experiment.	[2 marks]	
	Turn over for the next question		

The psychologist collated the responses of all the participants over the two-week p and calculated the mean and standard deviation for each condition.
