CAMBRIDGE INTERNATIONAL EXAMINATIONS

Cambridge International Advanced Level

MARK SCHEME for the October/November 2015 series

9608 COMPUTER SCIENCE

9608/33

Paper 3 (Written Paper), maximum raw mark 75

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge will not enter into discussions about these mark schemes.

Cambridge is publishing the mark schemes for the October/November 2015 series for most Cambridge IGCSE[®], Cambridge International A and AS Level components and some Cambridge O Level components.

® IGCSE is the registered trademark of Cambridge International Examinations.

| Page 2 | Mark Scheme | Syllabus | Paper |
|--------|---|----------|-------|
| | Cambridge International A Level – October/November 2015 | 9608 | 33 |

1 (a) (i) 00101000 00000011

| = <u>0.0101</u> × 2 ↑3 | [1] |
|------------------------|-----|
| =10.1 | [1] |
| =2.5 | [1] |

- (ii) For a positive number (mantissa starts with a zero) [1] bit after binary point (second bit from left) should be a one [1]
- (iii) 00101000 00000011 = 01010000 00000010 [1+1]
- **(b) (i)** 01111111 0111111 [1+1]
 - (ii) 01000000 1000000 [1+1]
 - (iii) number will become too large to represent [1] which will result in overflow [1]
- (c) Any point 1 mark
 - 0.1 cannot be represented exactly in binary
 - 0.1 represented here by a value just less than 0.1 the loop keeps adding this approximate value to counter until all accumulated small differences become significant enough to be seen

[max 3]

2 (a)

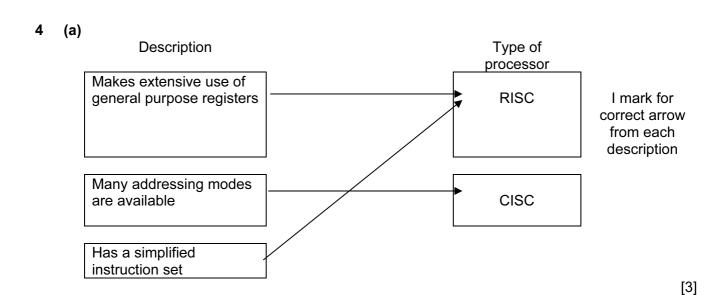

| | T. | | | |
|---------|-------|----------|--|--|
| Symbol | Token | | | |
| Зупівої | Value | Туре | | |
| Counter | 60 | variable | | |
| 1.5 | 61 | constant | | |
| Num1 | 62 | variable | | |
| 5.0 | 63 | constant | | |

(b) 5 6 6 6 0 6 4 6 0 6 0 0 3 2 2 2 0 В 2

[1+1]

| Page 3 Mark Scheme | Syllabus | Paper |
|--|-------------|------------|
| Cambridge International A Level – October/November 2015 | 9608 | 33 |
| (c) (i) Code optimisation | | [1] |
| (ii) LDD 234 ADD 235 | | [1] |
| ADD 236 STO 233 | | [1] |
| 1 mark for first 2 lines, 1 mark for last 2 lines, with no other lines a | added | |
| (iii) Code has fewer instructions/occupies less space in memory who minimises execution time of code//code will execute faster | en executed | [1] [1] |
| 3 (a) Any point 1 mark | | |
| sender's IP address receiver's IP address | | |
| packet sequence number checksum | | |
| | | [Max 2] |
| (b) Any point 1 mark | | |
| email has been split up into packets packet has destination address packets pass through many different routers in journey | | |
| packets pass through many different routers in journey packets don't take same route routers use IP addresses | | |
| packets reassembled at destination to rebuild email | | [Max 3] |
| | | |
| (c) Any point 1 mark | | |
| email message is only read when all of it is received time delays due to lost/delayed packets not significant so sending different packets by different routes is not issue/is efficient packets arriving out of order not an issue. | t | |
| packets arriving out of order not an issue no requirement for a continuous circuit (circuit switching) | | [Max 2] |
| (d) Circuit switching | | [1] |
| (e) e.g. real-time video/video conferencing | | [1] |
| Any point 1 mark | | |
| circuit made available is dedicated to this communication stream | | |
| full bandwidth available / no sharing no lost packets | | |

6

| (a) | A program is the written code ("static") A process is the executing code ("dynamic") | [1] [1] |
|-----|---|-------------------|
| (b) | running, ready: when process is executing it is allocated a time slice (running state)//process is allocated time on processor when time slice completed process/interrupt occurs can no longer use processor even though it is capable of further processing (ready state) | [1] [1] |
| | ready, running: process is capable of using processor (ready state) OS allocates processor to process so that process can execute (running state) | [1] [1] |
| | running, blocked: process is executing (running state) when it needs to perform I/O operation placed in blocked state – until I/O operation completed | [1] [1] |
| (c) | when I/O operation completed for process in blocked state process put in ready state OS decides which process to allocate to processor from the ready queue | [1] [1] [1] |
| (d) | high-level scheduler: decides which processes are to be loaded from backing store into memory/ready queue | [1] [1] |
