Paper 4 Alternative to Coursework May/June 2025

1 hour 30 minutes

0460/41

You must answer on the question paper.

You will need: Insert (enclosed) Ruler

Calculator Protractor

INSTRUCTIONS

- Answer all questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do not write on any bar codes.
- If additional space is needed, you should use the lined pages at the end of this booklet; the question number or numbers must be clearly shown.

INFORMATION

- The total mark for this paper is 60.
- The number of marks for each question or part question is shown in brackets [].
- The insert contains additional resources referred to in the questions.

1 Students in Shanghai, China, did fieldwork to compare different areas of the city. The part of Shanghai where they did their fieldwork is Pudong. The Pudong area has changed as it has been re-developed in the twenty-first century.

(a)	Use	Fig. 1.1 (Insert) to describe Pudong in the twenty-first century.
		[3]
		ct data, the students did fieldwork in five areas along a metro railway line which goes from to the rural-urban fringe. The five fieldwork areas are described in Fig. 1.2 (Insert).
One	e gro	up of students tested the following hypotheses:
Нур	oothe	esis 1: The land use varies between different areas of Pudong.
		esis 2: As distance from the CBD increases, the amount of traffic and the number of ans decrease.
(b)	To i	nvestigate Hypothesis 1 , the students recorded the main use of 100 buildings in each a.
	(i)	Describe a suitable method to select 100 buildings for their survey.
	<i>(</i> 11)	
	(ii)	Give two reasons why the method you described in (i) will give reliable results.
		1
		2
		[2]

(c) When they returned to school, the students put the use of their buildings into four groups. Their results are shown in Table 1.1 (Insert).

(i) Use the results in Table 1.1 to complete the pie graph for Sunland on Fig. 1.3. [3]

Land use in the five fieldwork areas

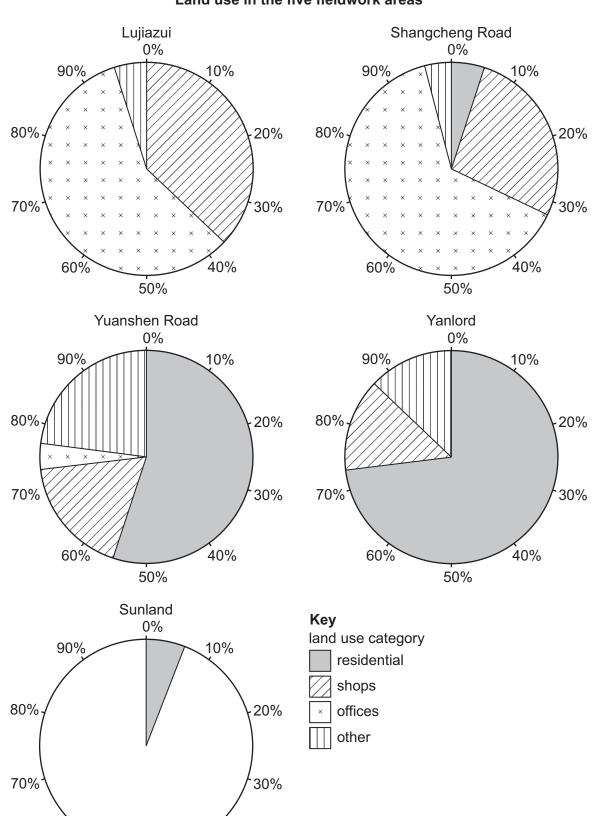

Fig. 1.3

(iii)	What conclusion would the students make about Hypothesis 1 : The land use varie between different areas of Pudong? Support your answer with evidence from Table 1. and Fig. 1.3 or Fig. 1.4.

- (d) To investigate **Hypothesis 2:** As distance from the CBD increases, the amount of traffic and the number of pedestrians decrease, the students used the method described in Fig. 1.5 (Insert), an extract from a student's fieldwork notebook.
 - i) From Fig. 1.5 identify **three** ways that the students made sure their method was reliable.

(f)

Which one of the following conclusions did the students make about Hypothesis 2: As distance from the CBD increases, the amount of traffic and the number of pedestrians decrease? Tick (✓) your decision.

	tick (✓)
The hypothesis is true for both traffic and pedestrians.	
The hypothesis is true for one and false for one.	
The hypothesis is false for both traffic and pedestrians.	
Support your decision with evidence from Fig. 1.6 and Table	1.2.
Other students investigated how the quality of the environment v of Pudong. Describe a fieldwork method they could use to do this	aried between the fiv

[Total: 30]

2 A class of students went on a field visit to some sand dunes on the east coast of England. Coastal sand dunes are popular places for people to visit but this may affect the natural environment.

Having studied the formation of sand dunes in class, the students wanted to find out more about their shape and the vegetation that grows on them.

- (a) Use the letters (A–E) to put the following statements in the correct order in the table to show the sequence of how sand dunes are formed.
 - A: Sand is deposited around the obstacles to form an embryo dune.
 - **B**: The onshore wind is slowed down by obstacles such as rocks and grass on the beach.
 - **C**: Constructive waves deposit sand on the beach.
 - D: Vegetation such as marram grass grows on the dunes helping to stabilise them.
 - **E**: The onshore prevailing wind blows dried sand inland.

order	letter
1	
2	
3	
4	
5	

[3]

The students tested the following hypotheses.

Hypothesis 1: The profile of sand dunes in the area matches a typical profile drawn in a textbook.

Hypothesis 2: The type of vegetation growing on the sand dunes changes as distance from the sea increases.

- (b) To investigate both hypotheses, the students used a tape measure to mark out a transect line from the sea going across the beach and sand dunes.
 - (i) Look at Fig. 2.1 (Insert). Identify the correct line for the students' transect. (Circle) your answer below.

	Α	В	С	D	[1]
ii)	Give one reason why	the line you ha	ive chosen is	the correct line.	

- (c) To investigate **Hypothesis 1**, the students measured the changing angle of slope every 10 metres across the sand dunes inland from the sea. They used:
 - a tape measure
 - two ranging poles
 - a clinometer app on their phone. This is shown in Fig. 2.2 (Insert).

E	xpl	ain how the students used this equipment to measure the angle of slope.	
		[4]
d) O	ne	student used their results to draw the profile shown in Fig. 2.3.	_
(i)	Complete the student's profile by joining the points between 140 and 180 m from the sea on Fig. 2.3.	
(ii))	Shade in the sand dunes on Fig. 2.3. [1]
(iii)	The students compared their profile in Fig. 2.3 with a textbook profile shown in Fig. 2.4 (Insert).	1
		They decided that Hypothesis 1 : The profile of sand dunes in the area matches a typical profile drawn in a textbook was partly true . Support this conclusion by referring to similarities and differences between the student's profile (Fig. 2.3) and the textbook profile (Fig. 2.4).	g
		[3]

distance from sea (m)

Fig. 2.3

11

- (e) To investigate **Hypothesis 2**: The type of vegetation growing on the sand dunes changes as distance from the sea increases, the students identified four types of vegetation growing on the sand dunes (reeds, heather, marram grass and couch grass).
 - The students used the quadrat, shown in Fig. 2.5 (Insert), to measure the different types (i) of vegetation cover at points 20 m apart along their transect line. How would the students use the quadrat? The students' results are shown in Table 2.1 (Insert). Use these results to plot the (ii) marram grass cover at 220 m and 240 m from the sea on Fig. 2.6. Do the students' results support Hypothesis 2: The type of vegetation growing on the (iii) sand dunes changes as distance from the sea increases? Use evidence from Fig. 2.6 and Table 2.1 to support your decision. Suggest **two** ways the students could have improved their fieldwork methods.
