

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use a pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer all questions.

Chemistry practical notes for this paper are printed on page 12.

At the end of the examination, fasten all your work securely together. The number of marks is given in brackets [] at the end of each question or part question.

For Exam	For Examiner's Use

This document consists of **13** printed pages and **3** blank pages.

- Www.papacambridge.com 1 You are going to investigate what affects the diffusion of hydrochloric acid into aga are provided with an agar block (of dimensions 20 mm x 10 mm x 10 mm) that cont phenolphthalein indicator and an alkali. Phenolphthalein is purple in pH greater than 8 and colourless in pH less than 8.
 - (a) (i) Cut the agar block in half, producing two blocks of size 10 mm x 10 mm x 10 mm (as shown in Fig. 1.1).
 - Keep one of these blocks intact (this is block **A**) and cut the other in half again (as shown in Fig. 1.1).
 - Keep one of these blocks intact (this is block **B**) and cut the other in half again. Discard one of these (as shown in Fig. 1.1.) The remaining block is block C.
 - You will now have three agar blocks of different surface areas.
 - Label the test-tubes A, B, and C.
 - Place about 20 cm³ of dilute hydrochloric acid in each of the three test-tubes A, B and C.
 - Using tweezers, drop each block into separate test-tubes (as shown in Fig. 1.1) as quickly as possible and start the stopclock.
 - Record the time taken, in Table 1.1, for each block to go completely colourless (as shown in Fig. 1.2). [3]

While you are waiting for the blocks to become colourless, you can be performing the calculations needed to complete Table 1.1.

Fig. 1.1

tube	Α	В	С
cube dimensions/mm	10 x 10 x 10	10 x 10 x 5	10 x 5 x 5
volume of block/mm ³			
surface area of block/mm ²	600	400	250
surface area to volume ratio /mm ⁻¹			
time taken for block to go colourless/s			

(ii) Calculate the volume of each block. Record the volumes in Table 1.1.

[1]

(iii) The surface to volume ratio is calculated using the following formula:

ratio = $\frac{\text{surface area of block/mm}^2}{\text{volume of block/mm}^3}$

Calculate the surface area to volume ratio for each block and record it in Table 1.1.

[1]

5 Explain why the blocks go colourless when placed in the acid.	For iner's
[2]	bridge com
Describe and explain the effect that the decrease in volume of the block has on the time taken for the colour to change.	
	5 Explain why the blocks go colourless when placed in the acid. [2] Describe and explain the effect that the decrease in volume of the block has on the time taken for the colour to change.

Please turn over for Question 2.

Table 2.1

_				WIN WAX	trap
Car	ry out the following tests	8 on solid X which is a mixture	e of t	wo salts. boxes in Table 2.1.	DaCa
		nd conclusions in the appropri		boxes in Table 2.1.	1
		Table 2.1			
	test	observation		conclusion	
	Mix one spatula full of solid X with two spatulas full of calcium hydroxide in a hard glass test-tube. Heat gently.				
	Test any gas with moist blue and red				
	litmus papers.		[1]		[2]
	Prepare about 20 cm^3 of a dilute solution of X in water for use in the tests below.				
	(i) To a portion of the solution of X , in a test-tube, slowly add aqueous				
	sodium hydroxide until there is no further change.		[2]		[1]
	 (ii) To another portion of the solution of X, very slowly 				
	add aqueous ammonia until there is no further change.		[1]		
((iii) To another portion of the solution of X, add dilute				
	hydrochloric acid.		ļ		
		·	[1]		[1]
(1	(iv) Acidify another portion of the solution of X with				
	dilute nitric acid, then add barium nitrate solution.		- 41		741
	mudio Solution.		[1]		[1]

 Acidify another portion of the solution of X with dilute nitric acid, 		Sambridge
then add silver nitrate solution.	[1]	[1]
Suggest names for the	two salts in mixture X .	

Fig. 3.2

- Place the glass block on the centre of the paper as shown in Fig. 3.1. Using a pencil, draw carefully around the block.
- Remove the block and construct a normal, 2 cm from the end of one of the long sides as shown in Fig. 3.2. Using a protractor, draw and label lines to represent incident rays with angles of incidence *i* of 20°, 40°, 60° and 80°.
- Replace the block carefully in the area marked on the paper. Place two pins about 4 cm apart on the incident ray for angle *i* = 20°.
- Look through the block from the other side and place two more pins (on the emergent ray) in line with the pins on the incident ray.
- Remove the block and draw a line to represent the emergent ray. Then continue the incident ray as shown by the dotted line in Fig. 3.2. Now measure the displacement *d* of the incident ray as shown in Fig. 3.2. Record the value of *d* in mm in Table 3.1.
- Repeat for the other angles of incidence $i = 40^\circ$, 60° , and 80° .

angle of incidence <i>i</i> /°	displacement <i>d</i> /mm
0	0
20	
40	
60	
80	

[5]

For iner's

(b) (i) Plot a graph of displacement d (vertical axis) against angle of incidence i. You will need to extend the axes to include $i = 90^{\circ}$. Draw the best **curve** through your points extending the curve to $i = 90^{\circ}$.

CHEMISTRY PRACTICAL NOTES

Test for anions

Test for anions	16 CHEMISTRY PRACTICAL NO	TES test result	con
anion	test	test result	on
carbonate (CO ₃ ²⁻)	add dilute acid	effervescence, carbon dioxide produced	
chloride (Cl ⁻) [in solution]	acidify with dilute nitric acid, then add aqueous silver nitrate	white ppt.	
nitrate (NO₃⁻) [in solution]	add aqueous sodium hydroxide then aluminium foil; warm carefully	ammonia produced	
sulfate (SO ₄ ²⁻) [in solution]	acidify then add aqueous barium chloride <i>or</i> aqueous barium nitrate	white ppt.	

Test for aqueous cations

cation	effect of aqueous sodium hydroxide	effect of aqueous ammonia
ammonium (NH_4^+)	ammonia produced on warming	-
copper(II) (Cu ²⁺)	light blue ppt., insoluble in excess	light blue ppt., soluble in excess giving a dark blue solution
iron(II) (Fe ²⁺)	green ppt., insoluble in excess	green ppt., insoluble in excess
iron(III) (Fe ³⁺)	red-brown ppt., insoluble in excess	red-brown ppt., insoluble in excess
zinc (Zn ²⁺)	white ppt., soluble in excess giving a colourless solution	white ppt., soluble in excess giving a colourless solution

Test for gases

gas	test and test results
ammonia (NH ₃)	turns damp red litmus paper blue
carbon dioxide (CO ₂)	turns limewater milky
chlorine (Cl ₂)	bleaches damp litmus paper
hydrogen (H ₂)	"pops" with a lighted splint
oxygen (O ₂)	relights a glowing splint
