### **Biology**

Assessment Unit AS 2 assessing

Organisms and Biodiversity

[AB121]

\*AB121\*

### **THURSDAY 23 JUNE, MORNING**

### TIME

1 hour 30 minutes.

#### **INSTRUCTIONS TO CANDIDATES**

Write your Centre Number and Candidate Number in the spaces provided at the top of this page. **You must answer the questions in the spaces provided.** 

Do not write outside the boxed area on each page or on blank pages.

Complete in blue or black ink only. Do not write with a gel pen.

Answer all eight questions.

You are provided with **Photographs 2.3A** and **2.3B** for use with **Question 3** in this paper. Do not write your answers on these photographs.

#### **INFORMATION FOR CANDIDATES**

The total mark for this paper is 75.

Section A carries 60 marks. Section B carries 15 marks.

Figures in brackets printed down the right-hand side of pages indicate the marks awarded to each question or part question.

You are reminded of the need for good English and clear presentation in your answers.

Use accurate scientific terminology in all answers.

You should spend approximately 20 minutes on Section B.

You are expected to answer Section B in continuous prose.

**Quality of written communication** will be assessed in Section B, and awarded a maximum of 2 marks.

# BLANK PAGE DO NOT WRITE ON THIS PAGE

		Section A	
1	(a)	Morphology (external features) provides one source of evidence when classifying organisms.	
		State <b>two</b> other sources.	
		1	
		2	[2]
	(b)	Identify the taxonomic rank which is made up of a group of genera.	
		<del></del>	[1]
	(c)	Organisms which are classified together are presumed to have a common ancestry.	

State the term used to describe this type of classification (taxonomy).

3	con	nmor	species and rocky shore plants such as samphire (Crithmum maritimum) are non the upper zones of rocky shores. They are most common in the spray ove the high tide mark.
	(a)	face surf on p	otograph 2.3A shows two different species of lichen growing on the vertical e of a rock beside a coastal path. These lichens grow very close to the rock face. This means that, once established, further growth can only take place parts of the rock surface that are not already colonised by other lichens. Most ens are very slow growing and grow best when their habitat is undisturbed.
		Usir	ng the information provided, answer the following questions.
		(i)	Suggest <b>one</b> way in which the rock face in the photograph provides a suitable habitat for these lichen species.
			[1]
		(ii)	Suggest the main resource these species of lichens compete for on the rock face.
			[1]
		(iii)	Suggest what is represented by the irregular lines on the lichens, labelled <b>X</b> .
			[1]
	(b)	the as a osm	<b>htograph 2.3B</b> shows samphire ( <i>Crithmum maritimum</i> ), growing just above high tide mark on the same rocky shore. The soils in this habitat are salty a result of sea spray. This makes it difficult for plants to absorb water by nosis. Consequently, samphire and many other plants found in this zone have ophytic adaptations.
		(i)	Using the photograph, state <b>one</b> xerophytic adaptation present in samphire.
			[1]
		(ii)	Suggest <b>one</b> other xerophytic adaptation that samphire would be expected to have.
			[1]

**4** The Fly Agaric *(Amanita muscaria)* is a common fungus found throughout most of Britain. It is easily recognised by the toadstool's bright red cap.

Red cap

Source: Chief Examiner

The cap develops in autumn and releases spores for reproduction and dispersal. However, most of the fungus exists as a network of microscopic underground hyphae that decomposes dead plant material in the ground.

(a)	The Fly Agaric has a lysotrophic mode of nutrition. Explain what is meant by the term 'lysotrophic'.

(	( <b>b)</b> The	e Fly Agaric is toxic to mammals, with particularly high levels of toxin in the o.
	(i)	Suggest the advantage to the Fly Agaric of having particularly high levels of toxin in the cap.
		[2]
	(ii)	Using your understanding of selection, explain how high levels of toxin might have evolved in the cap of this species.
		[4]

[Turn over

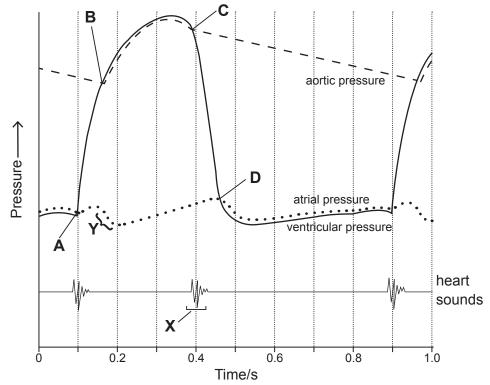

(c)	Until recently, it was assumed that fungi were relatively small organisms. This was partly due to only a small part of the fungus being visible above ground. However, DNA analysis has now shown that some individual fungi can grow beyond 100 metres in length.
	Suggest why it would have been difficult before DNA analysis to determine that fungi could reach this size.

	` ,	way	circulatory system of a mammalian foetus is different in some important s from that of an adult mammal. The foetus exchanges respiratory gases receives nutrients from its mother via the placenta.	
		atriu thes	ddition, in the foetal heart, most of the blood moves directly from the right im to the left atrium, through a small opening in the septum (wall) between e chambers. This means that in the foetus, very little blood enters the right ricle.	
		(i)	Suggest and explain why blood moves directly from the right atrium into the left atrium in the foetus.	
			[2]	
			In most babies, the small opening in the septum between the right and left atria closes soon after birth. However, in a small number of cases, the opening does not close fully. These babies often suffer from oxygen shortage in their body organs.	
			Suggest why these babies often suffer from oxygen shortage in their body organs.

Reser

7 (a) Orchids are small and delicate plants, which are rare in most Northern Ireland habitats. The different species are most easily identified by their distinctive flowers.

As each plant usually produces one spike (flower stalk), counting the number of spikes is a quick and relatively accurate way of counting the number of orchid plants in a particular habitat.

The numbers of plants for a range of orchid species in two different Northern Ireland habitats were counted in the summer of 2014. One habitat was an unimproved grassland, the other was a deciduous wood. The results (including Simpson's Index (**D**) for the unimproved grassland) are shown in the table below.

Niccondinate of the auto-

		Number of recor	•	
Orchid species	Flowering period	Unimproved grassland	Deciduous wood	Comments
Common spotted-orchid	May-August	25	7	Very common
Heath spotted-orchid	May-August	20	0	Common
Broad-leaved helleborine	July-October	0	27	Scattered distribution but common in some woods
Lesser twayblade	April– September	8	4	Not common
Bird's-nest orchid	April–June	0	5	Rare and declining in N Ireland
		D = 0.38		

(i)	Using the information provided, suggest why each habitat had to be sampled more than once to collect the orchid data.

(ii) Calculate the value for Simpson's Index (D) for the deciduous wood.

The formula for calculating **D** is presented as:

$$D = \frac{\sum n_i(n_i - 1)}{N(N - 1)}$$

n<sub>i</sub> = the total number of orchids of each individual species in the habitat

**N** = the total number of orchids of all species.

(Show your working.)

(iii) The unimproved grassland has no specific protection measures but the deciduous wood has been designated an ASSI. Using information from the table, suggest why the deciduous wood has been designated an ASSI.

\_\_\_\_\_ [1]

[Turn over

Reading I

20

Dearring

D

[4]

(iv)	The addition of fertiliser to unimproved grassland increases the nutrient content of the soil. This favours the growth of fast-growing grass species.	
	Suggest and explain how the <b>D</b> value for orchids of the unimproved grassland would be affected if the grassland was treated with fertiliser.	
	[2	2

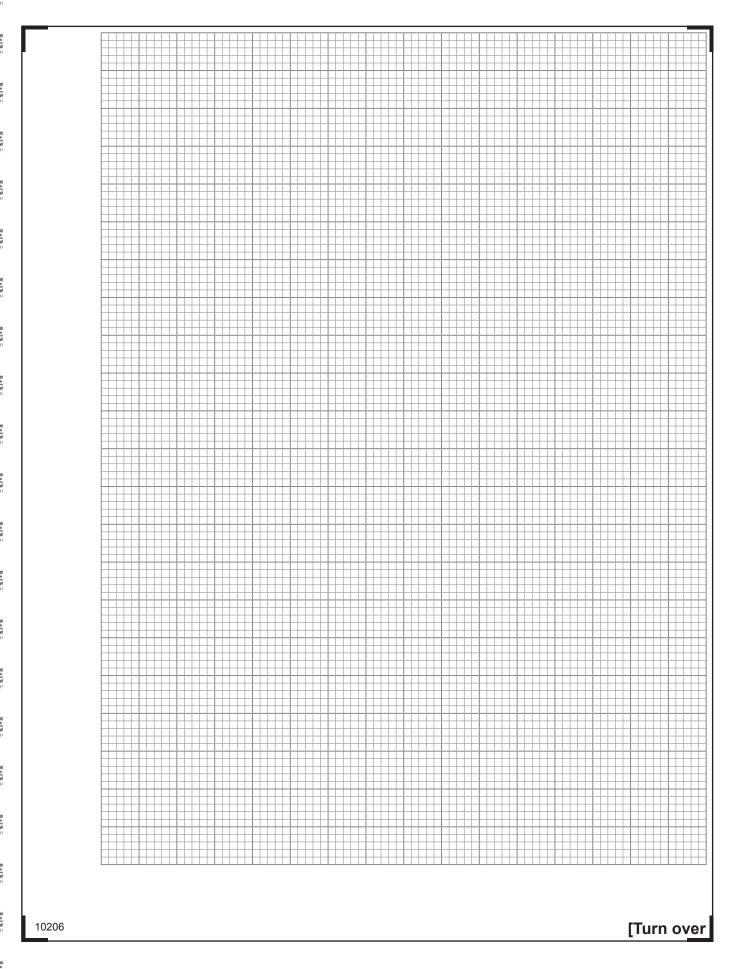

(b) (i) Using the information provided, draw a graph showing orchid numbers in the two habitats on the graph paper opposite.(The relevant information from page 16 is repeated below.)

	Number o	•
Orchid species	Unimproved grassland	Deciduous wood
Common spotted-orchid	25	7
Heath spotted-orchid	20	0
Broad-leaved helleborine	0	27
Lesser twayblade	8	4
Bird's-nest orchid	0	5

(ii) Which orchid species shows the largest difference between the numbers found in the two habitats?

Quality of written communication is awarded a maximum of 2 marks in this section.

- Haemoglobin is a protein which is highly adapted for transporting oxygen in the blood. In addition, its affinity for oxygen can change ensuring that sufficient levels of oxygen are delivered to, and released in, respiring tissues at times of high respiratory needs, e.g. during exercise, and for individuals living at high altitude.
  - (a) Describe and explain how the structure and properties of haemoglobin allow it to absorb oxygen and deliver it to respiring tissues. [6]
  - (b) Describe and explain how haemoglobin is able to maximise the delivery and release of oxygen during strenuous exercise and at high altitudes. [7]

Quality of written communication [2]

(a)	Describe and explain how the structure and properties of haemoglobin allow it to
	absorb oxygen and deliver it to respiring tissues.
