

ADVANCED SUBSIDIARY (AS) General Certificate of Education 2018

Chemistry

Assessment Unit AS 2

assessing Further Physical and Inorganic Chemistry and an Introduction to Organic Chemistry

[SCH22]

FRIDAY 25 MAY, MORNING

MARK SCHEME

General Marking Instructions

Introduction

The main purpose of the mark scheme is to ensure that examinations are marked accurately, consistently and fairly. The mark scheme provides examiners with an indication of the nature and range of candidates' responses likely to be worthy of credit. It also sets out the criteria which they should apply in allocating marks to candidates' responses.

Assessment objectives

Below are the assessment objectives for GCE Chemistry:

Candidates should be able to:

AO1	Demonstrate knowledge and understanding of scientific ideas, processes, techniques and procedures.
AO2	 Apply knowledge and understanding of scientific ideas, processes, techniques and procedures: in a theoretical context in a practical context when handling quantitative and qualitative data
AO3	 Analyse, interpret and evaluate scientific information, ideas and evidence (in relation to particular issues) make judgements and reach conclusions develop and refine practical design and procedures

Quality of candidates' responses

In marking the examination papers, examiners should be looking for a quality of response reflecting the level of maturity which may reasonably be expected of a 17- or 18-year-old which is the age at which the majority of candidates sit their GCE examinations.

Flexibility in marking

Mark schemes are not intended to be totally prescriptive. No mark scheme can cover all the responses which candidates may produce. In the event of unanticipated answers, examiners are expected to use their professional judgement to assess the validity of answers. If an answer is particularly problematic, then examiners should seek the guidance of the Supervising Examiner.

Positive marking

Examiners are encouraged to be positive in their marking, giving appropriate credit for what candidates know, understand and can do rather than penalising candidates for errors or omissions. The exception to this for GCE Chemistry is when examiners are marking complex calculations and mechanisms when the examiners are briefed to mark by error or omission. Examiners should make use of the whole of the available mark range for any particular question and be prepared to award full marks for a response which is as good as might reasonably be expected of a 17- or 18-year-old GCE candidate .

Awarding zero marks

Marks should only be awarded for valid responses and no marks should be awarded for an answer which is completely incorrect or inappropriate.

	Section A	AVAILABLE MARKS
1	В	
2	A	
3	C	
4	D	
5	D	
6	В	
7	D	
8	C	
9	D	
10	A	
[1]	for each correct answer [10]	10
	Section A	10

			Section B		AVAILABLE MARKS
11	(a)	prop	pan-2-ol/2-hydroxypropane	[1]	MARKS
	(b)	(i)	molecules which have the same molecular formula [1] but a different structural formula [1]	[2]	
		(ii)	Between molecules of ethyl methyl ether there are permanent dipole and/or van der Waals' forces [1] Between molecules of isopropyl alcohol there are H–bonds and (van der Waals' forces) [1] H–bonds are stronger/require more energy to break [1]	[3]	
	(c)	(i)	O 		
			structure [1]	[1]	
		(ii)	ketone	[1]	
		(iii)	disappearance of absorption peak at 3200–3600 cm ⁻¹	[1]	
	(d)	mol	$\frac{0}{2}$ = 0.025 es of propanone = 0.025 ected mass of propanone = 0.025 × 58 = 1.45g		
		% y	ield = $\frac{1.0}{1.45} \times 100 = 68.97\%$ ([-1] each error)	[3]	
	(e)	(i)	Isopropyl alcohol contains an OH group [1] and can form H-bonds with water molecules [1]	[2]	
		(ii)	increased competition for bonding with water molecules or		
			water molecules form stronger bonds with Na $^+$ /Cl $^-$ ions	[1]	15
12	(a)	Ca ₃	(PO ₄) ₂	[1]	
	(b)	(i)	Ca + 2H ₂ O \rightarrow Ca(OH) ₂ + H ₂	[2]	
		(ii)	fewer moles of strontium/strontium has a higher RAM.	[1]	
		(iii)	reaction faster/more vigorous [1] as strontium is more reactive [1] or		
			product mixture is less cloudy [1] as strontium hydroxide is more soluble [1]	[2]	
	(c)	(i)	thermal decomposition (breakdown using) heat	[1]	
		(ii)	thermal stability increases as Group is descended. [1] Cation radius increases. [1] Therefore polarising ability decreases.[1]	[3]	
	(d)	It is	a base	[1]
