**Friday 16 June 2017 – Afternoon****A2 GCE MATHEMATICS (MEI)****4758/01** Differential Equations**QUESTION PAPER**

Candidates answer on the Printed Answer Book.

**OCR supplied materials:**

- Printed Answer Book 4758/01
- MEI Examination Formulae and Tables (MF2)

**Other materials required:**

- Scientific or graphical calculator

**Duration:** 1 hour 30 minutes**INSTRUCTIONS TO CANDIDATES**

These instructions are the same on the Printed Answer Book and the Question Paper.

- The Question Paper will be found inside the Printed Answer Book.
- Write your name, centre number and candidate number in the spaces provided on the Printed Answer Book. Please write clearly and in capital letters.
- **Write your answer to each question in the space provided in the Printed Answer Book.** Additional paper may be used if necessary but you must clearly show your candidate number, centre number and question number(s).
- Use black ink. HB pencil may be used for graphs and diagrams only.
- Read each question carefully. Make sure you know what you have to do before starting your answer.
- Answer any **three** questions.
- Do **not** write in the barcodes.
- You are permitted to use a scientific or graphical calculator in this paper.
- Final answers should be given to a degree of accuracy appropriate to the context.
- The acceleration due to gravity is denoted by  $g \text{ ms}^{-2}$ . Unless otherwise instructed, when a numerical value is needed, use  $g = 9.8$ .

**INFORMATION FOR CANDIDATES**

This information is the same on the Printed Answer Book and the Question Paper.

- The number of marks is given in brackets [ ] at the end of each question or part question on the Question Paper.
- You are advised that an answer may receive **no marks** unless you show sufficient detail of the working to indicate that a correct method is being used.
- The total number of marks for this paper is **72**.
- The Printed Answer Book consists of **16** pages. The Question Paper consists of **4** pages. Any blank pages are indicated.

**INSTRUCTION TO EXAMS OFFICER/INVIGILATOR**

- Do not send this Question Paper for marking; it should be retained in the centre or recycled. Please contact OCR Copyright should you wish to re-use this document.

- 1 The displacement,  $x$  m, of a particle at time  $t$  s is given by the differential equation

$$\frac{d^2x}{dt^2} + 2\frac{dx}{dt} - 3x = 6\cos t.$$

- (i) Find the general solution. [8]

The particle is initially at rest, and its displacement remains bounded as  $t \rightarrow \infty$ .

- (ii) Find the particular solution for  $x$ . [4]

- (iii) Show that for large values of  $t$  the motion of the particle is oscillatory. Find the approximate amplitude of the oscillations. [2]

On another occasion, the displacement of the particle satisfies the differential equation

$$\frac{d^3x}{dt^3} + 2\frac{d^2x}{dt^2} - 3\frac{dx}{dt} = 0.$$

In this case, the particle is initially at the origin with acceleration  $6\text{ m s}^{-2}$  and velocity  $k\text{ m s}^{-1}$ , where  $k$  is a positive constant.

- (iv) Find the particular solution for  $x$  in terms of  $t$  and  $k$ . [8]

- (v) Show that, whatever the value of  $k$ , the displacement of the particle cannot remain bounded for large values of  $t$ . [2]

- 2 (a) A small particle moving in a fluid satisfies the differential equation

$$\frac{dv}{dt} = -0.25(v^2 + 2v),$$

where  $v\text{ m s}^{-1}$  is its velocity at time  $t$  s.

Given that  $v = 20$  when  $t = 0$ , find the particular solution for  $v$  in terms of  $t$ . [8]

- (b) The differential equation

$$x\frac{dy}{dx} - 4y = x^3\sqrt{x}$$

is to be solved for  $x > 0$ , subject to the initial condition  $y = 0$  when  $x = 1$ .

- (i) Find the particular solution for  $y$  in terms of  $x$ . [10]

- (ii) Find the  $x$ -coordinate of the stationary point on this solution curve. [2]

- (iii) State the value of  $\frac{dy}{dx}$  when  $x = 1$ . State also the limiting value of  $y$  as  $x \rightarrow 0$ . Hence, given that

the stationary point is a minimum, sketch a graph of your solution to part (i). [4]

- 3 (a) The differential equation  $\frac{dy}{dx} = \sqrt{x^2 + y^2}$  is to be investigated, firstly by means of a tangent field and then numerically.
- (i) Describe fully the isocline  $\frac{dy}{dx} = m$  where  $m$  is a positive constant. [1]
  - (ii) In the Answer Book, sketch on the given axes the isoclines  $\frac{dy}{dx} = m$  for  $m = \frac{1}{2}, 1, 2$  and  $3$  and hence draw a sketch of the tangent field. [4]
  - (iii) Sketch on your tangent field the solution curve through the point  $(0.5, 0.5)$  and the solution curve through the point  $(2, 0)$ . [3]

The differential equation is now to be solved numerically using Euler's method. The algorithm is given by

$$x_{r+1} = x_r + h, \quad y_{r+1} = y_r + hy'_r,$$

with  $(x_0, y_0) = (0.5, 0.5)$ .

- (iv) Use a step length of  $0.05$  to estimate  $y$  when  $x = 0.65$ . [4]
  - (v) How might the accuracy of your estimate for  $y$  be improved? [1]
- (b) Consider the differential equation

$$\frac{dy}{dx} + y = x^2 - 1.$$

- (i) Find the complementary function and the particular integral and hence state the general solution for this differential equation. [6]
- (ii) Find the particular solution for which  $y = 3$  when  $x = 0$ . [2]
- (iii) Show that  $y$  is always positive and sketch the solution curve for  $y$ . You do not need to find the coordinates of any stationary points. [3]

**Question 4 begins on page 4**

- 4 Two species of insects, X and Y, compete for survival on an island. The populations of the species are  $x$  and  $y$  respectively at time  $t$ , where  $t$  is measured in tens of years. The situation is modelled by the simultaneous differential equations

$$\frac{dx}{dt} = 2x + 2y,$$

$$\frac{dy}{dt} = 6y - 4x.$$

- (i) Eliminate  $y$  to obtain a second order differential equation for  $x$  in terms of  $t$ . Hence find the general solution for  $x$ . [7]

- (ii) Find the corresponding general solution for  $y$ . [4]

When  $t = 0$ ,  $\frac{dx}{dt} = 10$  and the population of species Y is  $k$  times the population of species X, where  $k$  is a positive constant.

- (iii) Find the particular solutions for  $x$  and  $y$ , in terms of  $t$  and  $k$ . [5]

Consider the case  $k = 6$ .

- (iv) Determine whether the model predicts that species X or species Y dies out first. State the value of  $t$  at which this first species dies out. [7]

- (v) Comment on why the time predicted by the model for the second species to die out is unreliable. [1]
