## Wednesday 6 June 2018 – Morning

### A2 GCE MATHEMATICS (MEI)

4757/01 Further Applications of Advanced Mathematics (FP3)

#### QUESTION PAPER

Candidates answer on the Printed Answer Book.

**OCR supplied materials:**

- Printed Answer Book 4757/01
- MEI Examination Formulae and Tables (MF2)

**Other materials required:**

- Scientific or graphical calculator

**Duration:** 1 hour 30 minutes

#### INSTRUCTIONS TO CANDIDATES

These instructions are the same on the Printed Answer Book and the Question Paper.

- The Question Paper will be found inside the Printed Answer Book.
- Write your name, centre number and candidate number in the spaces provided on the Printed Answer Book. Please write clearly and in capital letters.
- **Write your answer to each question in the space provided in the Printed Answer Book.** If additional space is required, you should use the lined page(s) at the end of this booklet. The question number(s) must be clearly shown.
- Use black ink. HB pencil may be used for graphs and diagrams only.
- Read each question carefully. Make sure you know what you have to do before starting your answer.
- Answer any **three** questions.
- Do **not** write in the barcodes.
- You are permitted to use a scientific or graphical calculator in this paper.
- Final answers should be given to a degree of accuracy appropriate to the context.

#### INFORMATION FOR CANDIDATES

This information is the same on the Printed Answer Book and the Question Paper.

- The number of marks is given in brackets [ ] at the end of each question or part question on the Question Paper.
- You are advised that an answer may receive **no marks** unless you show sufficient detail of the working to indicate that a correct method is being used.
- The total number of marks for this paper is **72**.
- The Printed Answer Book consists of **20** pages. The Question Paper consists of **4** pages. Any blank pages are indicated.

#### INSTRUCTION TO EXAMS OFFICER/INVIGILATOR

- Do not send this Question Paper for marking; it should be retained in the centre or recycled. Please contact OCR Copyright should you wish to re-use this document.

*Option 1: Vectors*

1 The equations of two planes,  $P$  and  $Q$ , are as follows.

$$\begin{array}{ll} P: & x + 2y - 2z = 11 \\ Q: & 2x - y + z = 7 \end{array}$$

The planes intersect in the line  $L$ .

(i) Find a cartesian equation for  $L$ . [5]

(ii) The point with coordinates  $(a, 1, 1)$  is equidistant from  $P$  and  $Q$ . Find the two possible values of  $a$ . [4]

The points B and C have coordinates  $(1, 2, 7)$  and  $(1, 0, -5)$  respectively.

(iii) Show that B lies on  $Q$  but not  $P$  and that C lies on  $P$  but not  $Q$ . Explain why this means that the lines BC and  $L$  are skew. [2]

(iv) Find the shortest distance between the lines BC and  $L$ . [5]

The point E is the mirror image of C in the plane  $Q$ , and O is the origin.

(v) Find the volume of the tetrahedron OBCE. [8]

*Option 2: Multi-variable calculus*

2 The surface  $S$  has equation  $z = x + 4x^2y - 2y^2 + 2$ .

(i) Show that the tangent plane to the surface at the point  $(1, 1, 5)$  has equation  $z = 9x - 4$ . [5]

(ii) Show also that if a tangent plane to  $S$  has equation  $z = 9x + k$  then the only possible value for  $k$  is  $-4$ . [3]

(iii) A point on the surface has coordinates  $(1 + a, 1 + a, 5 + b)$  where  $a$  and  $b$  are small. Show that  $b \approx \lambda a$ , where  $\lambda$  is a constant to be determined. [3]

(iv) Find the coordinates of the points on the surface at which the normal line is parallel to the vector  $\mathbf{i} + 16\mathbf{j} - \mathbf{k}$ . [4]

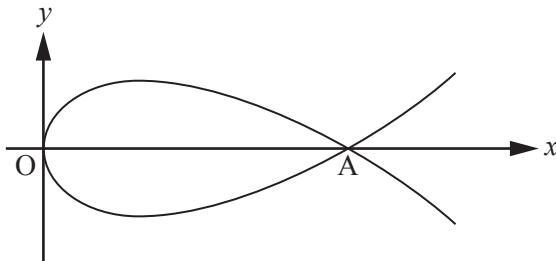

(v) Show that the only stationary point, A, on  $S$  has coordinates  $\left(-\frac{1}{2}, \frac{1}{4}, \frac{13}{8}\right)$ .

By finding the cross-sections through A parallel to  $x = 0$  and  $y = 0$  respectively, determine the nature of this stationary point. [9]

## Option 3: Differential Geometry

3 (a) Prove by integration that the surface area of a sphere with radius  $a$  is given by  $S = 4\pi a^2$ . [6]

(b) A curve has parametric equations  $x = 6t^2$ ,  $y = 4t - 3t^3$ . The curve crosses the  $x$ -axis at the origin O and at the point A, as shown in the diagram.

Find

(i) the values of  $t$  at the point A, [2]

(ii) the length of the arc OA for which  $t$  is positive, [6]

(iii) the radius and centre of curvature at the point where  $t = \frac{1}{3}$ . [10]

## Option 4: Groups

4 You are given that the set  $\{1, 2, 4, 7, 8, 11, 13, 14\}$  together with the binary operation of multiplication modulo 15 forms a group G.

(i) Find the order of each element of G. [4]

(ii) (A) A subgroup of G has order  $n$ . Write down the possible values of  $n$ . [2]

(B) State all the proper cyclic subgroups of G. [4]

(iii) For each of the following three cases, determine whether the set together with the binary operation forms a group. If the set does form a group, state whether or not it is isomorphic to G, justifying your answer. (You may assume that each of the binary operations is associative.)

(A) The set  $\{0, 1, 2, 3, 4, 5, 6, 7\}$  together with the binary operation of addition modulo 8.

(B) The set  $\{1, 2, 3, 4, 5, 6, 7, 8\}$  together with the binary operation of multiplication modulo 9.

(C) The set of matrices

$$\left\{ \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}, \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}, \begin{pmatrix} -1 & 0 \\ 0 & -1 \end{pmatrix}, \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, \begin{pmatrix} 0 & -1 \\ -1 & 0 \end{pmatrix}, \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}, \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix} \right\}$$

together with the binary operation of matrix multiplication. (You may assume that the set is closed under matrix multiplication.) [14]

## Option 5: Markov chains

**This question requires the use of a calculator with the ability to handle matrices.**

5 At a factory there are four security lights,  $A$ ,  $B$ ,  $C$  and  $D$ , only one of which is on at any time; which light is on at any time can be randomised by control equipment. A number of programs are devised so that the lights switch from one to another every minute with certain probabilities. For example, if  $A$  is on then at the next minute one of  $B$ ,  $C$  or  $D$  will come on, with probabilities determined by the particular program being used.

The time after the start of a program is denoted by  $t$  minutes. Light  $A$  comes on when  $t = 0$ .

For program 1 the transition matrix is as follows.

$$\mathbf{P}_1 = \begin{pmatrix} 0 & 0.2 & 0.1 & 0.4 \\ 0.2 & 0 & 0.6 & 0.4 \\ 0.3 & 0.4 & 0 & 0.2 \\ 0.5 & 0.4 & 0.3 & 0 \end{pmatrix}$$

The four rows and columns correspond to lights  $A$ ,  $B$ ,  $C$ ,  $D$  in that order.

(i) Interpret the values in the leading diagonal, stating the run length for each light. [2]

(ii) Find the probabilities that  $A$  comes on at  $t = 1, 2, 3$  and  $4$ . [4]

(iii) The equilibrium probability for  $A$  is  $a$ . From your working in part (ii), write down a range within which  $a$  lies. [2]

(iv) Find the probability that the light that comes on at  $t = 5$  is different from the light that comes on at  $t = 1$ . [5]

For program 2 the following rules apply.

- The light following  $A$  is always  $B$ .
- The light following  $B$  is never  $D$  and is equally likely to be  $A$  or  $C$ .
- The light following  $C$  is never  $A$  and is equally likely to be  $B$  or  $D$ .
- The light following  $D$  is always  $C$ .

(v) Write down the transition matrix,  $\mathbf{P}_2$ , for program 2. [2]

(vi) For program 2 identify any absorbing states and reflecting barriers. [3]

(vii) Find the proportions of times that each light is on over a long period. Give your answers as exact fractions. [6]
